A. Function

1. Principle of operation

A dirt trap stops any floating particles in the drinking water getting through. This significantly reduces any functional disturbances in the downstream Hawido regulating valve. The filter screen built into the housing must be periodically checked for dirt and cleaned if necessary.

Technical features:

Medium:	Drinking water
Pressure levels:	PN 10 – PN40
Flanges:	Connection dimensions according to DIN EN 1092 - 2
Overall length according to DIN:	EN-558
Housing/cover material in- and outside	EN-GJS-400-15,epoxy powder-coated
Filter screen material;	stainless steel
Temperature range:	2 – 40°C
Cuff width filter screen	0.6 mm (standard), 2.0 mm and 5.0 mm (irrigation)

2. General safety instructions

These instructions must be read through carefully and understood before starting the commissioning. Damage to property and injuries to persons could occur as a result of improper installation, commissioning, operation and maintenance.

The dirt trap is designed for use in the drinking water supply. Other application media only after consultation with the manufacturer.

The technical regulations (e.g. SVGW, ÖVGW, DVGW...) and codes of practice (e.g. VDE, VDI ...), laws and standards are taken as a minimum standard, and must be adhered to and applied.

In principle, the designer, installation company or the operator is responsible for the layout, installation position, installation and commissioning of the fittings in the pipe. Design or installation errors can adversely affect the safe operation of the dirt trap and can represent a significant risk. Please consult us in case of doubt.

3. Recommended installation

Before installing the fitting, the pipe lines must be carefully flushed through to prevent any foreign material, such as pieces of wood, stones etc., from entering the dirt trap.

To ensure the smooth functioning and maintenance of the dirt trap, we recommend installing it horizontally level whenever possible. It can also be installed vertically. However, when the water flows from the bottom to the top, the screen may not stop the floating particles from getting through.

Observe the installation direction of the dirt trap. There is an arrow on the housing.

A shut-off valve must be installed before and after the dirt trap when the filter screen is to be serviced or cleaned, if it has not already been designed with a Hawido regulating valve.

4. Dimension table

Article number	DN	PN	L	A	B	Z	Weight [kg]
2002 040 000	40	10 - 40	200	160	220	1/2"	9

B. Maintenance and replacement parts

1. Maintenance and service

1.1 General information

Under normal operating conditions, the dirt trap should be cleaned once a year.

Under exceptional operating conditions (e.g. high levels of floating particles in the water), it must be serviced more often.

Caution: The filter sieve (3) must be installed as shown (bracket across the direction of flow)!
