

HAWIDO - REGULATING VALVES

Instruction for

**On/Off valve for electrical drive
Type 1703/04**

ND40 - ND100

Keep this instruction manual at the location of the valve!

Example of rating plate

After the commissioning, enter the following data and make use of this additional information regarding the valve type, pressure and flow ratios when consulting the manufacturer or the supplier or asking them questions:

Serial number: DN PN:

Year of manufacture:.....

A. Description

1. Function

The HAWIDO 1703 and HAWIDO 1704 are valve units with an electrical solenoid valve. The filling or emptying of the control chamber of the main valve (1) are controlled by the electrical solenoid valve (5). The pressure of its own medium therefore closes or opens the valve. Depending on the electrical solenoid valve type (5), the valve can be positively or negatively controlled, i.e. the main valve (1) is normally-closed and opens under voltage (HAWIDO 1703), or it is normally open and closes when under voltage (HAWIDO 1704).

The closing speed can be adjusted using the one-way flow restrictor (4).

Technical features:

Medium:	Drinking water
Pressure stages:	PN 10 (from DN 200 Standard) PN16 (up to DN150 Standard) PN25
Flanges:	Connection dimensions according to DIN 1092 -2
Pressure gauge:	EN 837-1; Accuracy class 1.6
Main valve material:	EN-GJS-400-15
Temperature range:	2 – 40 °C

2. General safety instructions

These instructions must be read through carefully and understood before starting the commissioning. Damage to property and injuries to persons could occur as a result of improper installation, commissioning, operation and maintenance.

The Hawle regulating valve (HAWIDO) has been designed for use in drinking and process water supplies. Other application media only after consultation with the manufacturer.

The technical regulations (e.g. SVGW, ÖVGW, DVGW...) and codes of practice (e.g. VDE, VDI ...), laws and standards are taken as a minimum standard, and must be adhered to and applied.

Work on electrical installations (e.g. installation of magnetic position switches, solenoid valves, etc.) may only be carried out by personnel authorised for this work.

In principle, the responsibility for the layout, the installation position, the installation and the commissioning of the fittings in the pipe work lies with the designer, the installation company and/or the operator. Design or installation errors can adversely affect the safe operation of the regulating valve, and can represent a significant risk. Please consult us in case of doubt.

3. Recommended installation

Before the installation of the fitting, the pipe lines must be carefully blown or flushed through to prevent any foreign material, such as pieces of wood, stones etc., from entering the regulating valve.

The HAWIDO must be installed horizontally with the valve cover upwards (other models available on request). We recommend that a gate valve and a dirt trap be fitted in front of the valve, as well as the mounting of a gate valve at the outlet.

During maintenance, the valve must be decommissioned. A by-pass installation should be considered here in order to ensure the supply.

Before the installation, check that no coarse foreign objects can penetrate into the HAWIDO.

Please contact us for other types of installation.

Installation note:

The water will be drained out of the valve chamber when the solenoid valve is switched (5). This water must be led to the sewage system in accordance with local situation.

B. Commissioning

1. Functional diagram (1703)

Components

- | | |
|---|--|
| 1 | Main valve 1200 |
| 2 | Ball valve |
| 3 | Filter |
| 4 | One-way flow restrictor (flow control valve) |
| | Solenoid valve (drawn for Hawido Valve 1703, for Hawido Valve 1704 solenoid valve no flow without power) |
| 6 | Pressure gauge with ball valve |
| 7 | Valve opening limiter electrical position indicator (optional) |

2. Preparatory work

Before commissioning the valve, check that the gate valves on the inlet and outlet sides of the valve are **closed** and that the flange connections have been correctly tightened and sealed.

Attention: Electrical work may only be carried out by qualified specialist personnel!

On the valve:

- The ball valve (2A) must be opened and the lock nut of the adjusting screw on the one-way flow restrictor (4) must be loosened
- Unscrew the adjusting screw on the one-way flow restrictor (4) by approximately 10 turns. (The line to the control chamber is open).
- Loosen the threaded pin in the central plug on the position indicator by a few turns.
- Slightly loosen a union of the control line at its highest point (approximately one turn).
- The solenoid valve (5) - must be free from voltage for the Hawido **1703** or - must have voltage for the Hawido **1704**

3. Venting

Procedure:

Loosen the threaded pin of the optical position indicator 2 – 3 turns with a screwdriver (caution: Do not completely unscrew the threaded pin!)

Slowly open the inlet gate valve on the inlet side until water flows into the valve. The valve fills with water and the air escapes through the slightly open screw connection and the vent hole in the plug.

Once the valve venting procedure has caused all the air to be expelled from the control line, retighten the plug screw and the loosened union. Check that all the fittings are properly sealed, and re-tighten if necessary.

Slowly open the inlet gate valve completely.

Check: If the shut-off gate valve on the outlet side is slightly opened, the valve should close or remain closed. Then close the shut-off gate valve again.

If the valve does not close, the commissioning procedure must be repeated from the previous chapter. Particular care must then be taken to ensure that the upper valve chamber and control lines are properly vented.

4. Setting-up

Procedure:

- **Slowly** and gradually open the shutoff gate valve on the outlet side.
- After opening the shut-off gate valve on the outlet side, completely open the shut-off gate valve on the inlet side. The valve must remain closed.
- The solenoid valve (5) - is to have power applied to it (the main valve opens) on the Hawido 1703 or - is to have power removed from it on the Hawido 1704 (the main valve opens).

5. Setting the reaction speed

If the HAWIDO does not operate quietly, or if pressure shocks occur in the supply network, this can be corrected by the corresponding adjustment of the one-way flow restrictor (4).

Procedure:

Loosen the locknut. Screw in the set screw clockwise with a screwdriver until the valve operates quietly. Then retighten the locknut.

Caution The setting screw must always remain at least 2 -3 turns open, otherwise the valve will not re-open quickly enough after the closing sequence.
A special setting is necessary for very high inlet pressures.

6. Checking for leakage

HAWIDO valves are tested at the factory for both leakage and function before delivery. When checking for leakage under operational conditions, particular attention must therefore be given to the seals of the flange connections, the control line and the central plug screw on the valve cover. Where necessary, ensure the seal by retightening the connections.

7. Emergency manual operation 1703

If the valve has to be opened manually during a power failure, proceed as described below:

- Slowly close the ball valve (2)
- Slightly loosen the plug (or corresponding accessories such as: opening limiter, valve position indicator etc.) on the valve cover → the valve cover chamber drains itself and the valve opens.
- Put back into operation as described in the *Commissioning* chapter

Notes:

C. Fault finding

Symptoms	Possible cause	Action
Valve does not open	One-way flow restrictor blocked	Replace or unscrew the set screw several times until the valve functions properly
	One-way flow restrictor closed too far	Screw the set screw in and out until the valve functions properly
	Solenoid valve does not work	Check the function (electrical work may only be carried out by specialist personnel)
Valve does not close	One-way flow restrictor blocked	Replace, or screw the set screw fully in and out several times and then re-set
	Filter in the control line blocked	Clean the filter
	Air in the control line / upper valve chamber	Vent
	Foreign matter in the main valve	Carry out service and remove any foreign matter
	Diaphragm defective	Carry out a service. Replace the diaphragm
	Valve spindle jammed by encrustation	Carry out service and remove any encrustation
	Solenoid valve does not work	Check the function (electrical work may only be carried out by specialist personnel)
Loud noise	Unfavourable operating conditions	Slightly open or close the one-way flow restrictor; Inform Field Service
	Wrong valve size	Have the correct valve size calculated (contact Hawle)
Erratic operation	One-way flow restrictor incorrectly set	Re-set as described in the <i>Setting the Reaction Speed</i> chapter
EWS coating damaged	Transportation damage, installation damage	Repair with Hawle two-component repair set for coatings

D. Putting out of service and maintenance

1. Putting out of service

The operating valve must first be shut off hydraulically by proceeding as follows:

Attention: Electrical work may only be carried out by qualified specialist personnel!

- **Slowly** close the gate valves before and after the valve

In order to be able to carry out maintenance work on the valve, the solenoid valve must be disconnected from the power. The electrical supply must be disconnected.

The valve has now been taken out of operation, and a service can be carried out.

2. Maintenance and service

2.1 General information

Through our many years of experience with diaphragm valves that are controlled by the flow medium, we know that our HAWIDOs normally function trouble-free for many years. Regular maintenance is a precondition for this, however.

Under normal operating conditions, the following should be carried out:

- The valve should be checked for correct operation once a year (functional check)
- The dirt trap upstream of the valve and the filter in the control line should be cleaned once a year
- The inner working components should be checked and worn parts be replaced every four to five years (maintenance).

Under unusual operating conditions (e.g. with water that contains quantities of suspended matter, very high pressure reduction, small flow rates etc.), the functional checks and the service work should be carried out more frequently.

Maintenance sign:

Funktionskontrolle: jährlich	Wartung:	
Contrôle fonctionnel: annuel	Maintenance:	20xx
Prova di funzionamento: ogni anno	Mantenzione:	
Function check: annually	Maintenance:	

xx stands for the respective year.

2.2 Annual functional checks

Cleaning the dirt trap in the main line

- Unscrew the lid
- Clean the filter with a brush or cloth etc., or replace it
- Install the filter and screw the lid back on

Cleaning the filter in the control line

- Unscrew the lid of the filter
- Clean the filter with a brush or cloth etc., or replace it
- Re-install the filter and screw the filter lid back on.

Checking the valve

- Remove the optical position indicator on the valve.
- Check that the valve spindle moves easily by raising and lowering it with the threaded rod. Increased attention should be paid to this check, above all for valves with modified counter seats.
- Re-installation of the optical position indicator.

Putting back into service

- as described in the *Commissioning* paragraph

Functional check of the valve

- **Valve 1703:**
Solenoid valve (5) inactive (→ solenoid valve has flow) HAWIDO closes
Solenoid valve (5) has power (→ Solenoid valve closed) HAWIDO opens
- **Valve 1704:**
Solenoid valve (5) has power (→ solenoid valve has flow) HAWIDO closes
Solenoid valve (5) inactive (→ Solenoid valve closed) HAWIDO opens

2.3 4 to 5-year maintenance

Dirt trap (main line)

- Unscrew the lid
- Clean or replace the filter
- Install the filter and screw the lid back on

Filter (control line)

- Unscrew the lid of the filter
- Clean or replace the filter mesh
- Re-install the filter and screw the filter lid back on

Optical position indicator

- Dismount the optical position indicator.
- Clean the glass with a clean cloth
- Replace the seals (5)
- Reassembly; screw the double nipple and the screw plug together down to the stop

Base valve (see chapter: *Repair kits and spare parts*)

- Loosen the screw connections and remove the complete control line.
- Dismantle the optical position indicator or assembled accessories and replace the gaskets.
- Undo the screws of the valve cover and remove the cover.
- Visually inspect all inner components for wear, dirt and scaling
- Clean the inner components, the seat and the inner surfaces, including the cover
- Dismantle the spindle guide in the housing, flush the body interior
For valves DN 40 to DN 100 the spindle guide is dismantled from the inside. Here the thread of the spindle guide and the base valve must be **extremely clean**. Grease the thread thoroughly (e.g. Foodgrease Aqua, Art. no. 5292, see chapter "Control line individual parts and accessories").
- Replace the diaphragm, the O-ring and, if necessary, the seat seal
- Grease the spindle guide area with a grease suitable for contact with food (e.g. Foodgrease Aqua). Check the easy movement of the spindle.
- Reassemble the base valve (see table in the annex for torques). During the assembly, the easy movement of the spindle must be checked **several times** by actuating the threaded rod

Functional check of the one-way flow restrictor

- Undo the locknut
- Screw in the throttle screw, and then unscrew it as far as it goes
- Screw in again a few turns. This process must be easy and meet little resistance

Putting back into operation and functional check

- In accordance with the Putting into Operation and Functional Check chapter and the previous chapter

3. Repair kits and spare parts

Several replacement parts are required for the 4 or 5 - year service. These can be obtained as a repair kit for:

- the main valve
- the control valve
- the control line
- the optical position indicator

The article numbers can be found in the part lists and the lists of spare parts.

Attention:

When ordering replacement parts, always specify the valve type, serial number and year of construction!

Important:

Replacement parts made of EPDM (diaphragms, seals) and NBR (O-rings) must be stored in a dark place, protected from UV radiation!

Shelf-life when stored in the dark:

EPDM 8 years from date of manufacture

NBR 5 years from date of manufacture

E. Annex

1. Torques

When assembling the base valve and the control valves all **bolts** are checked with a torque spanner according to the following list. Lightly grease the bolts before assembling!

Base valves	Nominal size DN	Hex bolt M	Strength class ¹⁾	Tightening torque	
				Target	Max. ²⁾
	40 - 50	M 8	A4/80	22 Nm	25 Nm
	65 - 80	M 10		47 Nm	50 Nm
	100	M 12		84 Nm	87 Nm
	125 - 150	M 16		172 Nm	216 Nm
	200	M 20		285 Nm	423 Nm
	250	M 20		285 Nm	423 Nm
300	M 20	380 Nm		423 Nm	

Control valves	Type	Socket M	Strength class ¹⁾	Tightening torque	
				Target	Max.
	DRV / DAV	M 6	A2 / A4 / 70	8 Nm	8.5 Nm
	MBV / RBS				
Control valve	Hex bolt M	Strength class	Tightening torque		
NAZ	M 6	A2 / A4 / 70	8 Nm	8.5 Nm	

(Not for new applications)

Base valves	Nominal size DN	Hex bolt M	Strength class ¹⁾	Tightening torque	
				Target	Max.
	40 - 50	M 8	A2/70	17 Nm	19 Nm
	65	M 10		33 Nm	36 Nm
	80	M 10		40 Nm	40 Nm
	100	M 12		70 Nm	72 Nm
	125 - 150	M 16		172 Nm	172 Nm
	200	M 20		280 Nm	285 Nm
	250	M 20		280 Nm	285 Nm
300	M 20	235 Nm		240 Nm	

Attention: ¹⁾ = Note designation on screw head A2 – 70 or A4 – 80!

²⁾ = Maximum permitted torque according to strength analysis

Bolts according to SN EN ISO 4014 and SN EN ISO 4017

As at: FO 0065, Rev. 12 / 19.12.2017
